

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-5. (Cancelled)

6. (Currently amended) ~~The method as recited in claim 1~~ A method for backing up data, the method comprising:

establishing at a server a connection with a wireless device over a wireless network using a wireless protocol;

pushing, over the wireless network to the wireless device, a request to backup data, wherein the step of pushing the request comprises sending a textual based service load to a proxy server, wherein the service load provides a uniform resource identifier for an application that the wireless device may retrieve to transmit the data to the server, and wherein the proxy server is configured to translate the textual based service load to a binary based service load and send the translated binary based service load to the wireless device;

receiving the data from the wireless device; and

storing the data on a storage device coupled to the wireless network.

7. (Previously presented) The method as recited in claim 6, further comprising steps of:
sending a request by the wireless device to the proxy server to retrieve the application identified by the uniform resource identifier;
receiving the application by the wireless device; and
executing the application by the wireless device to transfer the data requested to be backed up.

8-9. (Cancelled)

10. (Currently amended) ~~The method as recited in claim 9~~ A method on a proxy server for facilitating data backup, the method comprising:

receiving a request in a first protocol from a backup server for a wireless client to backup data to the backup server, wherein the request is a textual based service load providing the client with a uniform resource identifier for an application which will identify, locate, and transmit the requested data to the backup server;

translating the request formatted in the first protocol into a translated request formatted in a second protocol, wherein the second protocol is compatible with the wireless client;
sending the translated request to the wireless client over a wireless network;
receiving over the wireless network the data from the wireless client formatted in a third protocol;
translating the data formatted in the third protocol into translated data formatted in a fourth protocol compatible with the backup server; and
sending the translated data to the backup server.

11. (Cancelled)

12. (Original) The method as recited in claim 10, wherein the third protocol is a wireless application protocol.

13. (Original) The method as recited in claim 10, wherein the fourth protocol is a hypertext transfer protocol.

14. (Previously presented) A method for backing up data, the method comprising:
responsive to receipt of a command from a backup server via a wireless network to backup data, retrieving, without user intervention, the data to be backed up from storage within a wireless client; and
transmitting, without user intervention, the data to be backed up to the backup server via the wireless network utilizing a wireless protocol, wherein the command from the backup server comprises a location of an application to be executed by the wireless client to transmit the data to be backed up to the backup server.

15. (Original) The method as recited in claim 14, wherein the data to be backed up is sent to the server by way of a proxy server and is sent using a wireless application protocol.

16. (Original) The method as recited in claim 14, further comprising:
transmitting a request to the backup server via the wireless network to retrieve backed up data;
receiving the backed up data from the backup server via the wireless network; and
storing the backed up data on the wireless client.

17-22. (Cancelled)

23. (Currently amended) ~~The computer program product as recited in claim 18~~ A computer program product in a computer readable media for use in a data processing system implemented as a server for backing up data, the computer program product comprising:

first instructions for establishing a connection with a wireless device over a wireless network using a wireless protocol;

second instructions for enabling a request to backup data to be pushed over the wireless network to the wireless device, wherein the request comprises a textual based service load and is sent to a proxy server, wherein the service load provides a uniform resource identifier for an application that the wireless device may retrieve to transmit the data to the server, and wherein the proxy server is configured to translate the textual based service load to a binary based service load and send the translated binary based service load to the wireless device;

third instructions for receiving the data from the wireless device; and

fourth instructions for storing the data on a storage device connected to the wireless network.

24. (Cancelled)

25. (Previously presented) A computer program product in a computer readable media for use in a data processing system implemented as a wireless client for backing up data, the computer program product comprising:

first instructions, responsive to receipt of a command from a backup server via a wireless network to backup data, for retrieving, without user intervention, the data to be backed up from storage within a wireless client; and

second instructions for enabling the transmission of the data, without user intervention, to be backed up to the server via the wireless network utilizing a wireless protocol, wherein the command from the backup server comprises a location of an application to be executed by the wireless client to transmit the data to be backed up to the backup server.

26-31. (Cancelled)

32. (Currently amended) ~~The system as recited in claim 31~~ A system for facilitating data backup, the system comprising:

a request receiver which receives a request in a first protocol from a backup server requesting that a wireless client backup data to the backup server, wherein the request is a textual based service load

providing the client with a uniform resource identifier for an application which will identify, locate, and transmit the requested data to the backup server;

a first translator which translates the request formatted in the first protocol into a translated request formatted in a second protocol, wherein the second protocol is compatible with the wireless client;

a first transmitter which sends the translated request to the wireless client via a wireless network;

a data receiver which receives the data from the wireless client via the wireless network formatted in a third protocol;

a second translator which translates the data formatted in the third protocol into translated data formatted in a fourth protocol compatible with the backup server; and

a second transmitter which sends the translated data to the backup server

33-35. (Cancelled)

36. (Previously presented) A system for backing up data to a server via a network, the system comprising:

a data retriever which, responsive to receipt of a command from a backup server via a wireless network to backup data, retrieves, without user intervention, the data to be backed up from storage within a client; and

a transmitter which transmits, without user intervention, the data to be backed up to the backup server via the wireless network utilizing a wireless protocol, wherein the command from the backup server comprises a location of an application to be executed by the wireless client to transmit the data to be backed up to the backup server.

37. (Original) The system as recited in claim 36, wherein the wireless device is a wireless phone.

38. (Original) The system as recited in claim 36, wherein the wireless device is a personal digital assistant.

39. (Cancelled)
